This ancient technique, now well-researched, can help patient ailments in every capacity.

How does Acupuncture work?

Acupuncture is the practice of penetrating the skin with thin needles in order to correct energy blockages or disruptions. By supporting the natural energy pathways in the body, acupuncture has a use in almost every case ranging from stress and anxiety, to childhood developmental delays, chronic pain, immune system dysfunctions, and neurological rehab.

Acupuncture is part of the ancient practice of Traditional Chinese Medicine, which is the oldest, most studied therapeutic and healing intervention in the world.

Meridian Pathways

Practitioners of acupuncture and Traditional Chinese Medicine utilize the body's network of energy pathways, or meridians, to improve energy flow to various parts of the body.
