

Chiropractic Medicine

This form of medicine focuses on proper alignment of the spine and how it impacts the entire body.

How does Chiropractic Medicine work?

Chiropractic medicine was originally developed to help treat the 3 T-s of dysfunction - Traumas, Thoughts, and Toxins. Chiropractic medicine is based on the core tenant that your body can heal itself with the help of specific hands-on manipulations from a trained professional. Chiropractic adjustments focus on alleviating symptoms that affect the musculoskeletal system. This could be to treat aches and pain, muscle stiffness or chronic conditions.

While current and emerging scientific literature continually finds new positives to chiropractic adjustments and other associated chiropractic work such as- functional movements, spinal decompression, manual therapies, flexion and distraction, and patient education.

The chiropractic field is exploding with new knowledge and specialties allowing for a wide variety of patients - not usually thought to be seen in a chiropractic office - to be effectively treated.

Clinically Proven Benefits

- Decreases pain
- Improves muscular functions
- Stimulates processing pathways in the brain & spinal cord to manage pain signals
- Improves the brain-body connection
- Enhances hormonal, endorphin, and white blood cell release
- Improves mood
- Promotes endogenous pain mitigation through neurochemicals

Symptoms Addressed

- Musculoskeletal pain
- Pre and post surgery complications
- Neurodevelopmental delays
- Behavioral dilemmas
- Headaches/migraines
- Anxiety
- Depression
- Processing delays
- Pain syndromes / chronic pain
- Movement disorders
- Dizziness & balance disorders
